ABSTRACT:

The present invention relates to a personal shopping system for combined use in both the home of a user and a shopping establishment. The system includes a host computer which is coupled to a host modem and, optionally, to at least one wireless multi-access point. At least one shopping establishment kiosk cradle is employed to interface with a portable terminal which is also part of the system. The portable terminal can be used in both the shopping establishment and the home of the user. It is configured to read bar codes associated with items related to shopping, and includes a memory, a bar code reader, a wireless transceiver, and a data interface. The data interface of the terminal communicates with a data interface of the shopping establishment kiosk cradle. A home cradle for the portable terminal is also provided and is adapted to remain in the home of the user. It includes a home portable terminal-receiving station and a home data interface to communicate with the data interface of the portable terminal. A home data transfer circuit is also included to permit data exchange between the home data interface and the modem coupled to the host computer. The portable terminal can be provided with unique identifying indicia so that the terminal can serve as a form of identification for a user of the system. Database management of shopping lists for multiple establishments, including customer preferences, can be performed.

ABSTRACT:

A method and system that enables service providers to receive an order from a mobile customer, receive customer location information from a location determination system, and schedule the completion of the customer's order to coincide with the customer's arrival at a local facility able to satisfy the customer's order. In one embodiment, the mobile customer is associated with a tracking device connected to a mobile location determination system that determines the customer's location, which is then given to the service provider. The service provider uses the customer's location to determine a local facility that can satisfy the customer's order. The service provider transmits the order to the local facility and schedules the fulfillment of the order to coincide with the customer's arrival at the local facility. To further expedite the order, customers may pay electronically for the service in advance. The service provider also may maintain a database of customer transactions that can be used to determine customer preferences.

TITLE: Method and apparatus for processing orders from customers in a mobile environment

Brief Summary Text (5):

Today's consumers are increasingly demanding that service providers deliver goods and services with a minimal amount of time spent waiting and often choose to patronize the service provider that promises the quickest response time. Customers traditionally have relied on two methods for reducing time spent waiting to pick up ordered goods: phone-in advance orders and "drive-thru" processes.

Brief Summary Text (6):

The traditional "drive-thru" process is inherently inefficient, however, because customers typically place their orders at the facility and then must wait for the goods to be produced. Efforts to reduce wait time by streamlining the drive-thru process have their own drawbacks and, in addition, only have reduced, but not eliminated, the amount of time the customer waits in line. The three window concept, or one window each for ordering, paying, and pick-up, for example, requires service providers to have more people involved in the ordering process and requires new building construction. Another disadvantage of this solution is that it is not readily adaptable to markets other than fast food meal processes.

Brief Summary Text (8):

A system where the customer uses a conventional phone to call in orders to the service provider from the home or office also is flawed. Customers, for example, may have a number of errands to run and may not be able to predict accurately when they will arrive at the pick-up facility. Because service providers typically begin processing an order upon receipt, this system may mean that the order is available for pick-up well before the customer arrives which is unsatisfactory in many situations, particularly when the order is for prepared, perishable items. Customers also may lose time by placing an order with a provider that either does not have the capacity to fill their order, or is not the closest facility to their next errand.

L17: Entry 1 of 1

File: USPT

Feb 15, 2000

DOCUMENT-IDENTIFIER: US 6026375 A

TITLE: Method and apparatus for processing orders from customers in a mobile environment

Brief Summary Text (3):

Busy people are constantly seeking ways to save time and are easily frustrated when they have to wait lengthy periods of time to receive goods or services from a service provider. Service providers recognize that shorter waiting periods increase customer satisfaction which ultimately results in increased sales. Accordingly, it is desirable for service providers to adopt methods of doing business that eliminate or greatly reduce the time the customer spends waiting to receive goods or services.

Detailed Description Text (3):

Consistent with the present invention, a mobile customer uses a communications device, such as a cellular phone or laptop computer communicating in a wireless mode or over the Internet, to order goods or services from a service provider. The term "service provider" is used herein to mean any entity that receives orders from customers and, in response to the orders, provides goods or services. Service providers may be, for example, a restaurant, a plumbing parts distributor, or a pharmacy dispensing prescription drugs. The term "customer" is used herein to mean any entity that procures the goods or services of the service provider whether for free or in exchange for compensation.

Detailed Description Text (10):

MCPE 105 also is capable of communicating with Financial System 158 via connection 116, which comprises a conventional communication device or system, such as the Internet, wireless cellular communications, or a telephone line. Financial System 158 may be a bank or other financial institution capable of issuing payment to the service provider for the goods or services on behalf of customer 100.

Detailed Description Text (17):

PAA 220 is a software agent that interacts directly with the customer, preferably through some type of natural dialog. A natural dialog is a means of communication between human and machine which does not require the human to know the communication requirements of the machine. Network Agent 225 is a software agent that communicates with other computers or agent systems through the appropriate types of protocols and agent communication languages in operations that are invisible to the user. Scheduling Agent 230 is a software agent that keeps track of the customer's location and the temporal information associated with activities of Customer 100 or PAS 210. Scheduling Agent 230 communicates with MLDS 145 to obtain information regarding the customer's position and transmits this information through Network Agent 225 to agents of SPS 150 that need this information.
